4/18/2022

2

## Introduction

- Additional latent variables allows to express relatively complex marginal distributions over latent variables in terms of more tractable joint distributions over the expanded space
- Maximum-Likelihood estimator in such a space is the Expectation-Maximization (EM) algorithm
- Chapter 10 provides Bayesian treatment using variational inference

4/18/2022

3

## K-Means Clustering: Distortion Measure

- Dataset  $\{\mathbf{x}_1, \dots, \mathbf{x}_N\}$
- Partition in  $K$  clusters
- Cluster prototype:  $\boldsymbol{\mu}_k$
- Binary indicator variable, 1-of- $K$  Coding scheme  
 $r_{nk} \in \{0, 1\}$   
 if  $\mathbf{x}_n$  is assigned to cluster  $k$  then  $r_{nk} = 1$ , and  $r_{nj} = 0$  for  $j \neq k$ .  
 (Hard assignment)
- Distortion measure

$$J = \sum_{n=1}^N \sum_{k=1}^K r_{nk} \|\mathbf{x}_n - \boldsymbol{\mu}_k\|^2$$

4/18/2022

4

## K-Means Clustering: Expectation Maximization

- Find values for  $\{r_{nk}\}$  and  $\{\boldsymbol{\mu}_k\}$  to minimize

$$J = \sum_{n=1}^N \sum_{k=1}^K r_{nk} \|\mathbf{x}_n - \boldsymbol{\mu}_k\|^2$$

- Iterative procedure:

- Minimize  $J$  w.r.t.  $r_{nk}$ , keep  $\boldsymbol{\mu}_k$  fixed (Expectation)

$$r_{nk} = \begin{cases} 1 & \text{if } k = \arg \min_j \|\mathbf{x}_n - \boldsymbol{\mu}_j\|^2 \\ 0 & \text{otherwise} \end{cases}$$

- Minimize  $J$  w.r.t.  $\boldsymbol{\mu}_k$ , keep  $r_{nk}$  fixed (Maximization)

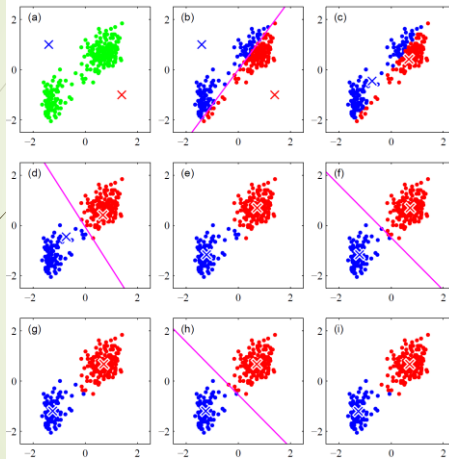

$$2 \sum_{n=1}^N r_{nk} (\mathbf{x}_n - \boldsymbol{\mu}_k) = 0$$

$$\boldsymbol{\mu}_k = \frac{\sum_n r_{nk} \mathbf{x}_n}{\sum_n r_{nk}}$$

4/18/2022

5

## K-Means Clustering: Example

- Each E or M step reduces the value of the objective function  $J$
- Convergence to a global or local minimum

4/18/2022

6

## K-Means Clustering: Concluding Remarks

- Direct implementation of  $K$ -Means can be slow
- Online version:

$$\mu_k^{\text{new}} = \mu_k^{\text{old}} + \eta_n (\mathbf{x}_n - \mu_k^{\text{old}})$$

- $K$ -medoids, general distortion measure

$$\tilde{J} = \sum_{n=1}^N \sum_{k=1}^K r_{nk} \mathcal{V}(\mathbf{x}_n, \mu_k)$$

where  $\mathcal{V}(\cdot, \cdot)$  is any kind of dissimilarity measure,  $\mu_k$  should be assigned with a sample value

4/18/2022

7

## K-Means Clustering: Image Segmentation

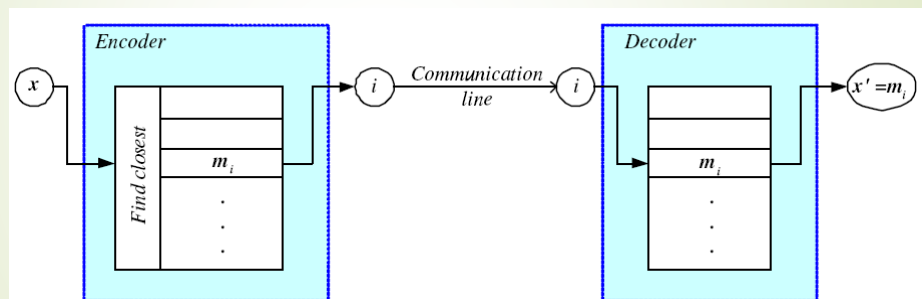

4/18/2022

Vector Quantization (VQ)

11

## Mixture of Gaussians: Latent variables

- Gaussian Mixture Distribution:

$$p(\mathbf{x}) = \sum_{k=1}^K \pi_k \mathcal{N}(\mathbf{x} | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)$$

- Introduce latent variable  $\mathbf{z}$

- $\mathbf{z}$  is a binary 1-of- $K$  coding variable
- $p(\mathbf{x}, \mathbf{z}) = p(\mathbf{z})p(\mathbf{x}|\mathbf{z})$

4/18/2022

12

## Mixture of Gaussians: Latent variables

- $p(z_k = 1) = \pi_k$

Constraints:  $0 \leq \pi_k \leq 1$ , and  $\sum_k \pi_k = 1$

- Because  $\mathbf{z}$  uses a 1-of- $K$  representation, we can rewrite  $p(\mathbf{z}) = \prod_{k=1}^K \pi_k^{z_k}$

- $p(\mathbf{x} | z_k = 1) = \mathcal{N}(\mathbf{x} | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)$

$$p(\mathbf{x} | \mathbf{z}) = \prod_{k=1}^K \mathcal{N}(\mathbf{x} | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)^{z_k}$$

- $p(\mathbf{x}) = \sum_{\mathbf{z}} p(\mathbf{x}, \mathbf{z}) = \sum_{\mathbf{z}} p(\mathbf{z})p(\mathbf{x}|\mathbf{z}) = \sum_k \pi_k \mathcal{N}(\mathbf{x} | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)$

- The use of the joint probability  $p(\mathbf{x}, \mathbf{z})$ , leads to significant simplifications

4/18/2022

13

## Mixture of Gaussians: Latent variables

- Responsibility of component  $k$  to generate observation  $\mathbf{x}$

$$\gamma(z_k) \equiv p(z_k = 1 | \mathbf{x}) = \frac{p(z_k = 1)p(\mathbf{x}|z_k = 1)}{\sum_k p(z_k = 1)p(\mathbf{x}|z_k = 1)} = \frac{\pi_k \mathcal{N}(\mathbf{x} | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)}{\sum_k \pi_k \mathcal{N}(\mathbf{x} | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)}$$

is the posterior probability

- Generate random samples with **ancestral sampling**:

First: generate  $\hat{\mathbf{z}}$  from  $p(\mathbf{z})$

Second: generate a value for  $\mathbf{x}$  from  $p(\mathbf{x}|\hat{\mathbf{z}})$

4/18/2022

14

## Mixture of Gaussians: Maximum Likelihood

- Log Likelihood

$$\ln p(\mathbf{X} | \boldsymbol{\pi}, \boldsymbol{\mu}, \boldsymbol{\Sigma}) = \sum_{n=1}^N \ln \left\{ \sum_{k=1}^K \pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k) \right\}$$

- Singularity** when a mixture component collapses on a datapoint

- Identifiability** for a ML solution in a  $K$ -component mixture there are  $K!$  equivalent solutions

Singularity

15

## EM for Gaussian Mixtures

- Informal introduction of expectation-maximization algorithm (Dempster et al., 1977).
- Maximum of log likelihood: setting the derivatives of  $\ln p(\mathbf{X}|\boldsymbol{\pi}, \boldsymbol{\mu}, \boldsymbol{\Sigma})$  w.r.t parameters to 0

$$\ln p(\mathbf{X}|\boldsymbol{\pi}, \boldsymbol{\mu}, \boldsymbol{\Sigma}) = \sum_{n=1}^N \ln \left\{ \sum_{k=1}^K \pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k) \right\}$$

- For  $\boldsymbol{\mu}_k$

$$0 = \sum_{n=1}^N \frac{\pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)}{\sum_j \pi_j \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_j, \boldsymbol{\Sigma}_j)} \boldsymbol{\Sigma}_k^{-1} (\mathbf{x}_n - \boldsymbol{\mu}_k)$$

$$\boldsymbol{\mu}_k = \frac{1}{N_k} \sum_{n=1}^N \gamma(z_{nk}) \mathbf{x}_n \quad N_k = \sum_{n=1}^N \gamma(z_{nk})$$

4/18/2022

16

## EM for Gaussian Mixtures

- For  $\boldsymbol{\Sigma}_k$

$$\boldsymbol{\Sigma}_k = \frac{1}{N_k} \sum_{n=1}^N \gamma(z_{nk}) (\mathbf{x}_n - \boldsymbol{\mu}_k)(\mathbf{x}_n - \boldsymbol{\mu}_k)^\top$$

- For  $\pi_k$

- Take into account constraint  $\sum_k \pi_k = 1$
- Lagrange multiplier

$$\ln p(\mathbf{X}|\boldsymbol{\pi}, \boldsymbol{\mu}, \boldsymbol{\Sigma}) + \lambda \left( \sum_{k=1}^K \pi_k - 1 \right)$$

$$0 = \sum_{n=1}^N \frac{\mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)}{\sum_j \pi_j \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_j, \boldsymbol{\Sigma}_j)} + \lambda \quad (\lambda = -N)$$

$$\pi_k = \frac{N_k}{N}$$

4/18/2022

17

## EM for Gaussian Mixtures Example

- No closed form solutions:  $\gamma(z_{nk})$  depends on parameters
- But these equations suggest simple iterative scheme for finding maximum likelihood:
  - Alternate between estimating the current  $\gamma(z_{nk})$  and updating the parameters  $\{\mu_k, \Sigma_k, \pi_k\}$
- More iterations needed to converge than  $K$ -means algorithm, and each cycle requires more computation
- It's common to use  $K$ -means to initialize parameters

4/18/2022

18

## EM for Gaussian Mixtures Example

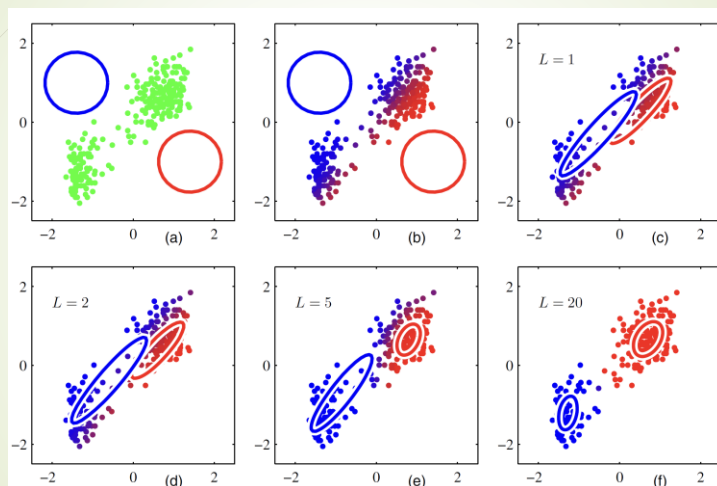

Illustration of the EM algorithm using the Old Faithful set as used for the illustration of the  $K$ -means algorithm

4/18/2022

19

## EM for Gaussian Mixtures Summary

1. Initialize  $\{\boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k, \pi_k\}$  and evaluate log-likelihood
2. **E-Step:** Evaluate responsibilities

$$\gamma(z_{nk}) = \frac{\pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)}{\sum_j \pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_j, \boldsymbol{\Sigma}_j)}$$

3. **M-Step:** Re-estimate parameters, using current responsibilities

$$\begin{aligned}\boldsymbol{\mu}_k^{\text{new}} &= \frac{1}{N_k} \sum_{n=1}^N \gamma(z_{nk}) \mathbf{x}_n \\ \boldsymbol{\Sigma}_k^{\text{new}} &= \frac{1}{N_k} \sum_{n=1}^N \gamma(z_{nk}) (\mathbf{x}_n - \boldsymbol{\mu}_k^{\text{new}})(\mathbf{x}_n - \boldsymbol{\mu}_k^{\text{new}})^\top \\ \pi_k &= \frac{N_k}{N} = \frac{\sum_{n=1}^N \gamma(z_{nk})}{N} \quad N_k = \sum_{n=1}^N \gamma(z_{nk})\end{aligned}$$

4. Evaluate log-likelihood  $\ln p(\mathbf{X} | \boldsymbol{\pi}, \boldsymbol{\mu}, \boldsymbol{\Sigma})$  and check for convergence (go to step 2)

$$\ln p(\mathbf{X} | \boldsymbol{\pi}, \boldsymbol{\mu}, \boldsymbol{\Sigma}) = \sum_{n=1}^N \ln \left\{ \sum_{k=1}^K \pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k) \right\}$$

4/18/2022

20

## An Alternative View of EM: Latent Variables

- Let  $\mathbf{X}$  observed data,  $\mathbf{Z}$  latent variables,  $\boldsymbol{\theta}$  parameters
- Goal: maximize marginal log-likelihood of observed data

$$\ln p(\mathbf{X} | \boldsymbol{\theta}) = \ln \left\{ \sum_{\mathbf{Z}} p(\mathbf{X}, \mathbf{Z} | \boldsymbol{\theta}) \right\}$$

- Optimization problematic due to **log-sum**
- Assume straightforward maximization for **complete data**

$$\ln p(\mathbf{X}, \mathbf{Z} | \boldsymbol{\theta})$$

- Latent  $\mathbf{Z}$  is known only through  $p(\mathbf{Z} | \mathbf{X}, \boldsymbol{\theta})$

$$\begin{aligned}\gamma(z_{nk}) &\equiv p(z_{nk} = 1 | \mathbf{x}_n) \\ &= \frac{\pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)}{\sum_k \pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)}\end{aligned}$$

- We will consider **expectation of complete data log-likelihood**

4/18/2022

21

## An Alternative View of EM: Algorithm

1. **Initialization:** Choose initial set of parameters  $\theta^{\text{old}}$
2. **E-step:** use current parameters  $\theta^{\text{old}}$  to compute  $p(\mathbf{Z}|\mathbf{X}, \theta^{\text{old}})$  to find the **expected complete-data log-likelihood** for general  $\theta$   
Evaluate  $p(\mathbf{Z}|\mathbf{X}, \theta^{\text{old}})$

$$\mathcal{Q}(\theta, \theta^{\text{old}}) = \sum_{\mathbf{Z}} p(\mathbf{Z}|\mathbf{X}, \theta^{\text{old}}) \ln p(\mathbf{X}, \mathbf{Z}|\theta) = \mathbb{E}_{\mathbf{Z}|\mathbf{X}, \theta^{\text{old}}} [\ln p(\mathbf{X}, \mathbf{Z}|\theta)]$$

3. **M-step:** determine  $\theta^{\text{new}}$  by maximizing
 
$$\theta^{\text{new}} = \arg \max_{\theta} \mathcal{Q}(\theta, \theta^{\text{old}})$$
4. **Check convergence:** stop, or  $\theta^{\text{old}} \leftarrow \theta^{\text{new}}$  and go to **E-step**

4/18/2022

22

## Gaussian Mixtures Revisited

- For mixture assign each  $\mathbf{x}$  latent assignment variables  $z_{nk}$
- Complete-data (log-)likelihood, and expectation:

$$p(\mathbf{X}, \mathbf{Z}|\mu, \Sigma, \pi) = \prod_{n=1}^N \prod_{k=1}^K \pi_k^{z_{nk}} \mathcal{N}(\mathbf{x}_n|\mu_k, \Sigma_k)^{z_{nk}}$$

$$\ln p(\mathbf{X}, \mathbf{Z}|\mu, \Sigma, \pi) = \sum_{n=1}^N \sum_{k=1}^K z_{nk} (\ln \pi_k + \ln \mathcal{N}(\mathbf{x}_n|\mu_k, \Sigma_k))$$

4/18/2022

23

## Gaussian Mixtures Revisited

- But these equations suggest a simple iterative scheme for finding maximum likelihood:

$$p(\mathbf{X}, \mathbf{Z} | \boldsymbol{\mu}, \boldsymbol{\Sigma}, \boldsymbol{\pi}) = \prod_{n=1}^N \prod_{k=1}^K [\pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)]^{z_{nk}}$$

$$\ln p(\mathbf{X}, \mathbf{Z} | \boldsymbol{\mu}, \boldsymbol{\Sigma}, \boldsymbol{\pi}) = \sum_{n=1}^N \sum_{k=1}^K z_{nk} (\ln \pi_k + \ln \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k))$$

- Cross-reference: the log-likelihood of incomplete data

$$\ln p(\mathbf{X} | \boldsymbol{\pi}, \boldsymbol{\mu}, \boldsymbol{\Sigma}) = \sum_{n=1}^N \ln \left\{ \sum_{k=1}^K \pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k) \right\}$$

24

## Gaussian Mixtures Revisited

- But these equations suggest a simple iterative scheme for finding maximum likelihood:

$$p(\mathbf{Z} | \mathbf{X}, \boldsymbol{\mu}, \boldsymbol{\Sigma}, \boldsymbol{\pi}) = \prod_{n=1}^N \frac{p(\mathbf{x}_n | \mathbf{z}_n) p(\mathbf{z}_n)}{p(\mathbf{x}_n)} \propto \prod_{n=1}^N \prod_{k=1}^K [\pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)]^{z_{nk}}$$

- The expected value of  $z_{nk}$  under this posterior distribution is

$$\mathbb{E}[z_{nk}] = \frac{\sum_{\mathbf{z}_n} z_{nk} \prod_{k'} [\pi_{k'} \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_{k'}, \boldsymbol{\Sigma}_{k'})]^{z_{nk'}}}{\sum_{\mathbf{z}_n} \prod_i [\pi_i \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_i, \boldsymbol{\Sigma}_i)]^{z_{ni}}} = \frac{\pi_k \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k)}{\sum_{j=1}^K \pi_j \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_j, \boldsymbol{\Sigma}_j)} = \gamma(z_{nk})$$

- The expected value of the complete-data log likelihood function:

$$\mathbb{E}_{\mathbf{Z}}[\ln p(\mathbf{X}, \mathbf{Z} | \boldsymbol{\mu}, \boldsymbol{\Sigma}, \boldsymbol{\pi})] = \sum_{n=1}^N \sum_{k=1}^K \gamma(z_{nk}) (\ln \pi_k + \ln \mathcal{N}(\mathbf{x}_n | \boldsymbol{\mu}_k, \boldsymbol{\Sigma}_k))$$

4/18/2022

25

## EM Example: Bernoulli Mixtures

- Bernoulli distributions over binary data vectors

$$p(\mathbf{x}|\boldsymbol{\mu}) = \prod_{i=1}^D \mu_i^{x_i} (1 - \mu_i)^{1-x_i}$$

- Mixture of Bernoullis can model variable correlations
- Same as the Gaussian, Bernoulli is member of exponential family
  - Model log-linear, mixture not, complete-data log-likelihood is
- Simple EM algorithm to find ML parameters
  - E-step: compute responsibilities  $\gamma(z_{nk}) \propto \pi_k p(\mathbf{x}_n|\boldsymbol{\mu}_k)$
  - M-step: update parameters  $\pi_k = N^{-1} \sum_n \gamma(z_{nk})$  and  $\boldsymbol{\mu}_k = N_{\pi_k}^{-1} \sum_n \gamma(z_{nk}) \mathbf{x}_n$

26

## EM Example: Bayesian Linear Regression

- Recall Bayesian linear regression: it's a latent variable model

$$p(\mathbf{t}|\mathbf{w}, \beta, \mathbf{X}) = \prod_{n=1}^N \mathcal{N}(t_n | \mathbf{w}^\top \boldsymbol{\phi}(\mathbf{x}_n), \beta^{-1})$$

$$p(\mathbf{w}|\alpha) = \mathcal{N}(\mathbf{w} | \mathbf{0}, \alpha^{-1} \mathbf{I})$$

$$p(\mathbf{t}|\alpha, \beta, \mathbf{X}) = \int p(\mathbf{t}|\mathbf{w}, \beta) p(\mathbf{w}|\alpha) d\mathbf{w}$$

- Simple EM algorithm to find ML parameters  $(\alpha, \beta)$ 
  - E-step: compute responsibilities over latent variable  $\mathbf{w}$
  - $p(\mathbf{w}|\mathbf{t}, \beta, \mathbf{X}) = \mathcal{N}(\mathbf{w} | \mathbf{m}, \mathbf{S})$ ,  $\mathbf{m} = \beta \mathbf{S} \boldsymbol{\Phi}^\top \mathbf{t}$ ,  $\mathbf{S}^{-1} = \alpha \mathbf{I} + \beta \boldsymbol{\Phi}^\top \boldsymbol{\Phi}$
  - M-step: update parameters using complete-data log-likelihood

$$\alpha = \frac{M}{\mathbf{m}_N^\top \mathbf{m}_N + \text{Tr}(\mathbf{S}_N)}$$

$$(\beta^{\text{new}})^{-1} = \frac{1}{N} (\|\mathbf{t} - \boldsymbol{\Phi} \mathbf{m}_N\|^2 + \beta^{-1} \sum_i \gamma^i)$$

4/18/2022

27

## The EM Algorithm in General

- EM is a general technique for finding maximum likelihood solutions for probabilistic models having latent variables
- Let  $\mathbf{X}$  denote observed data,  $\mathbf{Z}$  latent variables,  $\theta$  parameters
- Goal: maximize the marginal log-likelihood of observed data

$$\ln p(\mathbf{X}|\theta) = \ln \left\{ \sum_{\mathbf{Z}} p(\mathbf{X}, \mathbf{Z}|\theta) \right\}$$

- Maximization of  $p(\mathbf{X}, \mathbf{Z}|\theta)$  is simple, but it's difficult for  $p(\mathbf{X}|\theta)$
- Given any  $q(\mathbf{Z})$ , we decompose the data log-likelihood

$$\ln p(\mathbf{X}|\theta) = \mathcal{L}(q, \theta) + \text{KL}(q(\mathbf{Z}) \| p(\mathbf{Z}|\mathbf{X}, \theta))$$

$$\mathcal{L}(q, \theta) = \sum_{\mathbf{Z}} q(\mathbf{Z}) \ln \frac{p(\mathbf{X}, \mathbf{Z}|\theta)}{q(\mathbf{Z})}$$

$$\text{KL}(q(\mathbf{Z}) \| p(\mathbf{Z}|\mathbf{X}, \theta)) = - \sum_{\mathbf{Z}} q(\mathbf{Z}) \ln \frac{p(\mathbf{Z}|\mathbf{X}, \theta)}{q(\mathbf{Z})} \geq 0$$

4/18/2022

28

## Lower Bound of $\ln p(\mathbf{X}|\theta)$

- Jensen's inequality

$$\begin{cases} \varphi(\mathbb{E}[\mathbf{Y}]) \geq \mathbb{E}[\varphi(\mathbf{Y})] & \text{if } \varphi(\mathbf{Y}) \text{ is concave} \\ \varphi(\mathbb{E}[\mathbf{Y}]) \leq \mathbb{E}[\varphi(\mathbf{Y})] & \text{if } \varphi(\mathbf{Y}) \text{ is convex} \end{cases}$$

- Since  $\ln f(\mathbf{X})$  is concave,  $\ln \mathbb{E}[f(\mathbf{X})] \geq \mathbb{E}[\ln f(\mathbf{X})]$

$$\begin{aligned} \ln p(\mathbf{X}|\theta) &= \ln \sum_{\mathbf{Z}} p(\mathbf{X}, \mathbf{Z}|\theta) = \ln \sum_{\mathbf{Z}} q(\mathbf{Z}) \frac{p(\mathbf{X}, \mathbf{Z}|\theta)}{q(\mathbf{Z})} = \ln \mathbb{E}_{\mathbf{Z} \sim q(\mathbf{Z})} \left[ \frac{p(\mathbf{X}, \mathbf{Z}|\theta)}{q(\mathbf{Z})} \right] \\ &\geq \mathbb{E}_{\mathbf{Z} \sim q(\mathbf{Z})} \left[ \ln \frac{p(\mathbf{X}, \mathbf{Z}|\theta)}{q(\mathbf{Z})} \right] = \sum_{\mathbf{Z}} q(\mathbf{Z}) \ln \frac{p(\mathbf{X}, \mathbf{Z}|\theta)}{q(\mathbf{Z})} = \mathcal{L}(q, \theta) \end{aligned}$$

- Given any  $q(\mathbf{Z})$ , we decompose the data log-likelihood

$$\ln p(\mathbf{X}|\theta) = \mathcal{L}(q, \theta) + \text{KL}(q(\mathbf{Z}) \| p(\mathbf{Z}|\mathbf{X}, \theta))$$

$$\mathcal{L}(q, \theta) = \sum_{\mathbf{Z}} q(\mathbf{Z}) \ln \frac{p(\mathbf{X}, \mathbf{Z}|\theta)}{q(\mathbf{Z})}$$

$$\text{KL}(q(\mathbf{Z}) \| p(\mathbf{Z}|\mathbf{X}, \theta)) = - \sum_{\mathbf{Z}} q(\mathbf{Z}) \ln \frac{p(\mathbf{Z}|\mathbf{X}, \theta)}{q(\mathbf{Z})} \geq 0$$

4/18/2022

29

## The EM Algorithm in General: The EM Bound

- $\mathcal{L}(q, \theta)$  is a lower bound on the data log-likelihood
  - $-\mathcal{L}(q, \theta)$  known as variational free-energy
 
$$\mathcal{L}(q, \theta) = \ln p(\mathbf{X}|\theta) - \text{KL}(q(\mathbf{Z})\|p(\mathbf{Z}|\mathbf{X}, \theta)) \leq \ln p(\mathbf{X}|\theta)$$
- The EM algorithm performs coordinate ascent on  $\mathcal{L}$ 
  - E-step maximizes  $\mathcal{L}$  w.r.t.  $q$  for fixed  $\theta$
  - M-step maximizes  $\mathcal{L}$  w.r.t.  $\theta$  for fixed  $q$

4/18/2022

30

## The EM Algorithm in General: The E-step

- E-step maximizes  $\mathcal{L}$  w.r.t.  $q$  for fixed  $\theta^{\text{old}}$ 

$$\mathcal{L}(q, \theta^{\text{old}}) = \ln p(\mathbf{X}|\theta^{\text{old}}) - \text{KL}(q(\mathbf{Z})\|p(\mathbf{Z}|\mathbf{X}, \theta^{\text{old}}))$$
- $\mathcal{L}$  is maximized for  $q(\mathbf{Z}) \leftarrow p(\mathbf{Z}|\mathbf{X}, \theta^{\text{old}})$

4/18/2022

31

## The EM Algorithm in General: The M-step

- M-step maximizes  $\mathcal{L}$  w.r.t.  $\theta$  for fixed  $q$

$$\begin{aligned}\mathcal{L}(q^*, \theta) &= \sum_{\mathbf{Z}} q^*(\mathbf{Z}) \ln p(\mathbf{X}, \mathbf{Z} | \theta) - \sum_{\mathbf{Z}} q^*(\mathbf{Z}) \ln q(\mathbf{Z}) \\ &= \sum_{\mathbf{Z}} p(\mathbf{Z} | \mathbf{X}, \theta^{\text{old}}) \ln p(\mathbf{X}, \mathbf{Z} | \theta) - \sum_{\mathbf{Z}} p(\mathbf{Z} | \mathbf{X}, \theta^{\text{old}}) \ln q(\mathbf{Z})\end{aligned}$$

- $\mathcal{L}$  maximized for  $\theta^{\text{new}} = \arg \max_{\theta} \sum_{\mathbf{Z}} p(\mathbf{Z} | \mathbf{X}, \theta^{\text{old}}) \ln p(\mathbf{X}, \mathbf{Z} | \theta)$

32

## Picture in Parameter Space

- E-step resets bound  $\mathcal{L}(q, \theta)$  on  $\ln p(\mathbf{X} | \theta)$  at  $\theta = \theta^{\text{old}}$ , it is
  - tight at  $\theta = \theta^{\text{old}}$
  - tangential at  $\theta = \theta^{\text{old}}$
  - convex (easy) in  $\theta$  for exponential family mixture components

4/18/2022

33

## The EM Algorithm in General: Final Thoughts

- ▀ (local) maxima of  $\mathcal{L}(q, \theta)$  correspond to those of  $\ln p(\mathbf{X}|\theta)$
- ▀ EM converges to (local) maximum of likelihood
  - ▀ Coordinate ascent on  $\mathcal{L}(q, \theta)$ , and  $\mathcal{L} = \ln p(\mathbf{X}|\theta)$  after E-step
- ▀ Alternative schemes to optimize the bound
  - ▀ Generalized EM: relax M-step from maximizing to increasing  $\mathcal{L}$
  - ▀ Expectation Conditional Maximization: M-step maximizes w.r.t. groups of parameters in turn
  - ▀ Incremental EM: E-step per data point, incremental M-step
  - ▀ Variational EM: relax E-step from maximizing to increasing  $\mathcal{L}$ 
    - ▀ no longer  $\mathcal{L} = \ln p(\mathbf{X}|\theta)$  after E-step
- ▀ Same applies for MAP estimation  $p(\theta|\mathbf{X}) = p(\theta) p(\mathbf{X}|\theta)/p(\mathbf{X})$ 
  - ▀ bound second term:  $\ln p(\theta|\mathbf{X}) = \ln p(\theta) + \mathcal{L}(q, \theta) - \ln p(\mathbf{X})$

4/18/2022
